## Premium Quality Bushings Are Key To Eliminating Chassis Noise & Vibration

The main purpose of a bushing is to reduce vehicle noise vibration and harshness. The bushings absorb road shock by compressing and twisting. Rubber bushings are typically used as original equipment applications.

Typical warning signs are when a vehicle shimmies after hitting a bump, wanders on a straight, level road or you hear a clunk when turning corners.

Falcon Steering bushings are made from **Thermoplastic Vulcanizate Elastomers (TPV)** for increased service life beyond typical rubber bushings. This material combines excellent physical properties and chemical resistance and won't get hard and brittle or crack with age. This material also provides good high compression strength and good energy absorbing capabilities to ensure better ride control.

Track Bar Split Bushing Kit

Radius Arm Split Bushing Kit

Falcon supplies an improved **"Split Bushing"** design which allows for easier removal and replacement of old worn out bushings. In many cases the mechanic does not have to remove the track bar, control arm or radius arm to do the repair.

The result is a savings on time & labor, while ensuring a better ride control and durability.

All products are designed and produced to meet OEM standards and our facilities adhere to the latest ISO9001:2000 and TS14949:2002 registered quality systems.

Strut Rod Split Bushing Kit

**Note :** There will be a price adjustment effective 2/9/2009 on chassis only. Please contact your local Falcon sales representative for pricing details.
